1 **I. INTRODUCTION**

2 **1. Growth Management Act Requirements**

3 The Growth Management Act (GMA) requires jurisdictions to prepare a utilities
4 element that addresses “the general location, proposed location and capacity of all
5 existing and proposed utilities, including, but not limited to, electrical lines,
6 telecommunications lines, and natural gas lines.”
7

8 **2. Purpose of Utilities Element**

9 The Utilities Element inventories the general location of existing and proposed
10 utilities, and analyzes the capacity to serve planned land uses. The GMA defines
11 utilities as integrated facility systems that serve the public by means of a network of
12 wires or pipes, and ancillary structures. Included are systems for the delivery of
13 natural gas, electricity, and telecommunications services, water systems, and
14 sewage disposal. Utilities are distinguished from other capital facilities as essential
15 services necessary to support basic life needs. Due to the high cost of utility
16 infrastructure necessary to deliver the utility service, residents pay a fee for utility
17 services while other capital facility services such as police and fire protection are
18 funded by the whole community through taxes.
19

20 Water supply, sanitary sewers and storm sewers may also be considered as “public
21 facilities” and the Growth Management Act requires that jurisdictions consider the
22 capital improvement aspect of these utilities in the Capital Facilities element.
23 Accordingly, the Capital Facilities Element provides level of service standards,
24 projects capital facility needs and includes utility capital improvements in the 6-year
25 Capital Facilities Plan. Utilities are either publicly or privately owned. Private utilities
26 are regulated by a variety of entities. Natural gas and telephone utilities are
27 regulated by the Washington Utilities and Transportation Commission, and cellular
28 telephone communication companies are licensed by the Federal Communication
29 Commission. Utility providers are primarily responsible for planning utility services.
30

31 However, the City will incorporate utility plans into its comprehensive planning
32 efforts in order to coordinate the quality and delivery of services with anticipated
33 patterns of land use. It may also assist utility providers in identifying ways of
34 improving services provided in the City. The information included in this element
35 will assist in ensuring the orderly and efficient provision of utility services to the City
36 and in the City Planning or Urban Growth Area (UGA).

- 1 The following utilities are addressed in this Element:
2 1. Water Supply;
3 2. Sanitary Sewer;
4 3. Storm water and Drainage;
5 4. Electricity;
6 5. Natural Gas; and
7 6. Telecommunication System.
8

9 **II. EXISTING CONDITIONS AND CAPACITY**

10 **1. Water Supply**

11 **a. Existing conditions**

12 The City of Brier is provided with municipal water by the Alderwood Water &
13 Wastewater District (District). The District’s retail water service area encompasses
14 approximately 44 square miles. The District is responsible for constructing,
15 repairing, maintaining and servicing water lines as well as providing potable water
16 to the City’s residents, as established by Ordinance No. 336.
17

18 Alderwood Water & Wastewater District purchases treated water from the City of
19 Everett. The City of Everett water supply originates in Spada Lake in the Sultan
20 Basin and is “preset” in Lake Chaplain after passing through Snohomish County
21 PUD’s water power generating system.
22

23 The District has entered into a long-term wholesale water supply agreement with
24 Everett that extends until January 1, 2055. The agreement will supply the District’s
25 project demands (including the City of Brier) through that period.
26

27 The District has three water storage reservoirs that serve Brier. The reservoirs are
28 located at 156th Street SW and 36th Street W in Lynnwood’s Municipal Urban
29 Growth Area. The three reservoirs have 73 million gallons of available capacity for
30 the 635 Pressure Zone which includes the City of Brier.
31

32 Fire flow analyses were conducted throughout the District, including Brier. This
33 analysis was performed with the hydraulic analysis model using 2044 peak day
34 demand conditions. The results showed that the distribution system is able to meet
35 the current fire flow needs throughout most of the City. There are small areas
36 where fire flow is deficient due to the age, size, and type of distribution pipe.
37 Planned improvements will enhance the level of service in these areas by 2044.
38

1 **b. Capacity**

2 Brier’s population and housing projections for the planning period (through 2044) is
3 7,100 persons, and 2,894 households. The number of gallons used by each single-
4 family household per day has been decreasing since 1968 and is expected to
5 continue to decrease due, in part, to conservation efforts, plumbing code changes
6 and rate increases. Average daily demand per household in 2024 of 174.5 gallons
7 per day (gpd). Average daily demand in 2044 in Brier, without conservation, is
8 projected to be 346,000 gpd, and maximum (peak day) demand is expected to be
9 573,000 gpd.

10
11 The District expects a continued increase in residential and commercial growth
12 through 2044 and beyond.

13
14 Specific improvements will be necessary in order to maintain and increase the level of
15 service for the District’s customers and meet the needs of growth. The target level
16 of service is a minimum pressure of 30 psi (pounds per square inch).

17
18 The analysis of current conditions, future demand and ability to provide services
19 through the year 2044 assumes that growth and development will occur in Brier
20 consistent with its Comprehensive Plan and zoning. With scheduled improvements,
21 the District states that there will be sufficient capacity to serve planned growth.

22
23 **2. Sanitary Sewer**

24 **a. Existing Conditions**

25 Sanitary sewage collection is provided by the City of Brier. There are currently 2,150
26 sewer connections in the City. Collection lines feed into two trunk lines. A 15-inch
27 trunkline follows Oak Way in the northeast Brierwood section of the City, and ties
28 into the 36-inch Swamp Creek trunk line that is operated by the Alderwood Water
29 and Wastewater District. Approximately one-third of the sewer connections are
30 routed to the north and east through this trunk line. The rest of the sewer
31 connections are routed to the 15-inch Lyons Creek trunk line, which extends
32 southwest from 228th Street SW into Mountlake Terrace. This trunk line is owned
33 by both the City of Brier and Mountlake Terrace. Both the Swamp Creek and Lyons
34 Creek trunk lines connect to the Kenmore Interceptor, which is owned and
35 operated by King County. Sewage from the City of Brier flows to either the West
36 Point Treatment Plant in Seattle or Brightwater Treatment Plant in Woodinville.

37
38 There are 12 sewer basins within the Brier service area, plus an additional one
39 called the AWWD basin that is within the Alderwood Water and Wastewater

1 District's service area. The basins are as follows: 1) Brier Road; 2) Brierwood; 3)
2 Alder; 4) Vine Road; 5) Shasta; 6) Old Poplar Way; 7) Crestview; 8) Castle Crest;
3 9) AWWD; 10) Basin B; 11) East; 12) Southeast; and 13) Northwest.

4

5 Most areas of the City are presently served by a sanitary sewer system, though
6 several areas remain served by on-site septic systems. These areas are generally
7 located in the southeast, southwest, and northwest corners of the City and east of
8 Brier Road, between Vine Road and 232nd Street SW. Sewer mains have recently
9 been extended along Vine Road, making eventual sewer connection a possibility for
10 homes there. The other areas have remained on septic systems because they are
11 either difficult to serve due to local topography or because the existing low- density
12 development has not warranted extension of sewer service.

13

14 Some problems with failing septic systems persist in these areas. A few homes in
15 the Skyline Hills area have addressed these problems by installing pumps, but there
16 still is potential for additional homes to experience septic tank failure.

17

18

b. Capacity

19 The Comprehensive Sanitary Sewer Plan indicates that the existing Brier sewer
20 system capacity is adequate to accommodate the proposed development density
21 buildout and peak wastewater flow conditions. Two areas in the Brier Road Basin
22 (generally in the south central part of Brier) are close to capacity at peak flow
23 conditions. Further study on inflow and infiltration issues and remediation program
24 is recommended to mitigate these issues. In addition, at buildout, there may be a
25 surcharge at manhole #485 in the Brierwood Sewer Basin (generally the northern
26 part of Brier), which could require mitigation.

27

28 In 2011 the Golden View Pump Station was removed. Development on Atlas Road
29 provided a sewer connection for Basin B to connect by gravity flow to Alderwood
30 Water and Wastewater District's sewer system without the need for the Golden
31 View Pump Station. The entire city sewer system is now gravity flow.

32

33 Potential projects also include providing sewer service to the unsewered areas
34 within the service area. A total of 23 sewer extensions are proposed in the
35 Comprehensive Sanitary Sewer Plan to accomplish that project. In Brier, sewer lines
36 are commonly extended or improved in the developed areas by means of Utility
37 Local Improvement Districts (ULIDs) and extensions to serve new development are
38 the responsibility of the developer. Service rate increases may also be necessary if
39 the potential sewer utility expenditures exceed revenue.

1
2 **c. Sewage Treatment**

3 Sewage treatment is provided by King County Wastewater Treatment Division
4 (WTD) through an intergovernmental agreement. Sewage from the City of Brier
5 flows to either the West Point Treatment Plant in Seattle or Brightwater Treatment
6 Plant in Woodinville. The West Point and Brightwater Treatment Plants have
7 average wet weather capacity of 133 and 30 million gallons per day (mgd) and a
8 peak hydraulic capacity of 440 and 130 mgd respectively.
9

10 In order to ensure wastewater conveyance and treatment capacity in the future
11 WTD routinely reviews local comprehensive plans and compares growth
12 projections to census data and population forecasts prepared by the Puget Sound
13 Regional Council. WTD also looks at its own wastewater flow and monitoring data,
14 and further truth-tests projections by running the data through system models to
15 determine where future system capacity might be needed.
16

17 Recent reviews by WTD of regional conveyance and treatment plants capacity
18 indicate that the existing capacity along with planned upgrades will provide
19 adequate capacity to treat the City's wastewater through the 2044 comprehensive
20 plan horizon.
21

22 **3. Stormwater and Drainage**

23 **a. Existing Conditions**

24 In 2015, a Stormwater Management Plan was prepared for the City of Brier by PACE
25 Engineers, Inc. The Plan focuses on stormwater management throughout the city
26 and provides a strategy for managing the City's stormwater runoff quantity and
27 quality. A more recent update was completed in 2022, but that was to update the
28 city's stormwater utility rates and four Capital Improvement Projects
29

30 The 2015 Stormwater Management Plan identified four primary watersheds in
31 Brier: Swamp Creek; Scriber Creek (tributary to Swamp Creek); Lyon Creek; and
32 Creek 0056 ("Abbey View Drainage"). The Swamp Creek watershed consists of
33 approximately 222 acres and is located in the east central part of Brier. The Scriber
34 Creek watershed is the largest watershed, containing approximately 476 acres, and
35 is located in the north part of the City. The Lyon Creek watershed is located in west
36 central Brier and is comprised of approximately 215 acres. Creek 0056 is located in
37 the south part of Brier and consists of approximately 450 acres.
38

39 Brier is served primarily by a system of open grass-lined ditches and 12-inch

1 diameter storm drains/culverts with catch basins in the older, developed areas of
2 the City. In the newer developments in the City, stormwater detention vaults and
3 detention pipes are used for stormwater drainage.

4
5 The Stormwater Management Plan identifies general drainage problems in Brier
6 that include local ponding, erosion, basement or crawl space flooding, and potential
7 water quality problems. The Plan concludes that these problems are due to the
8 increase of impervious surface and the presence of glacial till soils in the area.

9
10 There are four areas of concern identified in the Stormwater Management Plan:

- 11
12 1. Murphy Regional Detention Pond. The pond needs repairs to prevent
13 subsurface water from piping beneath its berm and migrating finer material
14 from the berm.
- 15 2. Brierwood Stormwater Pond Retrofit-Bioretenion Cell. This project will provide
16 stormwater treatment for water entering Scriber Creek, a salmonid-bearing
17 creek.
- 18 3. Stormwater Decant Facility. The decant facility will capture sediment before
19 the decant water drains into the sanitary sewer system. An oil/water separator
20 may also be provided.
- 21 4. Abbeyview Pond Conveyance Channel. This project would replace existing
22 culverts to prevent flooding.

23 24 **b. Capacity**

25 New development in the City is required to provide stormwater detention facilities
26 to mitigate downstream drainage impacts. Stormwater detention facilities are
27 designed to insure that peak discharge rates from a site do not exceed
28 predevelopment existing conditions. The City has adopted the Washington
29 Department of Ecology (DOE) standards. Brier Municipal Code states that the most
30 current version of the Stormwater Management Manual for Western Washington
31 is adopted. This ensures that the City always requires the most recent standards.

32 33 **c. Drainage Courses**

34 The Scriber Creek Watershed Management Plan was developed under an interlocal
35 agreement between the cities of Brier, Lynnwood, and Snohomish County. The
36 Plan evaluates stream conditions, habitats, and water quality in the entire
37 watershed, and recommends a combination of regulations, education, and capital
38 projects to prevent future flooding and to maintain water quality in Scriber Creek.
39 In addition, the Plan recommends specific local and regional capital projects to

1 protect surface water resources. Implementation of the Plan has been ongoing
2 over the past decade.

4 **4. Electricity**

5 **a. Existing Conditions**

6 The Snohomish County Public Utility District No. 1 supplies electricity to the City of
7 Brier. Electricity is supplied to the area by an 115,000-volt transmission line, located
8 along 228th Street SW. This transmission line serves a system of distribution
9 substations, which reduce the current to 12,470 volts. From the substations, 12,470-
10 volt distribution lines run along local streets, and transformers further reduce the
11 voltage to 240 and 480 for distribution to residences and commercial/industrial
12 users.

13
14 The substation which serves most of Brier is located near 228th Street SW and 40th
15 Avenue W, in Mountlake Terrace. The substation has a capacity of 28 MVA. There is
16 also a Snohomish County PUD substation located just north of the City Limits, near
17 the intersection of Cypress Way and Larch Way. This substation also has a 28 MVA
18 capacity. The PUD designs its substations to accommodate a second bank of
19 transformers for an additional 28 MVA capacity.

20
21 Seattle City Light has an 115,000 volt transmission line that runs diagonally through
22 the City along its own right-of-way.

23 **b. Capacity**

24
25 According to officials with the Snohomish County PUD No. 1, there are no existing
26 plans to expand electrical facilities within the Brier planning area. The Utility
27 projects future needs based on “small area forecasts,” which anticipate utility needs
28 for reliability during peak load demand. Officials indicated that with respect to
29 current load forecasts, the existing system facilities are adequate to serve projected
30 growth for the next 5-10 years.

1 **5. Natural Gas**

2 **a. Existing Conditions**

3 Puget Sound Energy (PSE) is certified by the State Utilities and Trade Commission to
4 provide natural gas to the Puget Sound area, which lies along the route of the
5 Northwest Pipeline. The Brier planning area is included within the PSE service area.
6 The Northwest Pipeline originates in Canada and consists of two pipes: a 26 inch
7 diameter pipe designed to carry natural gas at a pressure of 600 pounds per square
8 inch; and a 30 inch pipe designed for 1,000 pounds of pressure. The main Pipeline
9 route is east of Woodinville and Redmond, with lateral lines that branch off in south
10 Snohomish County to facilitate service to areas. The Brier planning area is served
11 primarily from PSE lines which branch off the Northwest Pipeline lateral in the
12 Mountlake Terrace Distribution lines (six to eight inches in diameter), which in turn
13 branch off the main PSE supply lines. As of February 1999, there were 1,341 natural
14 gas connections in Brier.

15
16 Puget Sound Energy has established as its optimum service standard a pressure of
17 45 pounds per square inch (psi), and as the minimum service threshold a pressure
18 of 15 psi. Generally, residences in Brier are served by gas lines that provide 35 (psi).
19 During high demand periods, gas pressure is increased from the district regulator
20 to provide adequate pressure. According to PSE officials, the local capacity in Brier
21 may be increased by “looping” existing systems to provide alternate directions of
22 supply.

23 **b. Capacity**

24 PSE officials have indicated that the natural gas supply system will be able to meet
25 the demand for natural gas within the planning area over the next 20 years. PSE
26 does not anticipate the need for additional pipeline corridors within the Brier
27 planning area.

28
29 **6. Telecommunication System**

30 **a. Telephone**

31 Ziplly Communications provides telephone, televisions and internet service
32 throughout the City of Brier planning area. Telephone system facilities include
33 central office exchange switching stations, trunk lines which connect switching
34 stations and distribution lines which run along streets to serve homes and
35 businesses. The distribution lines are either pole-mounted or underground.

36
37 **b. Cellular Telephone Systems**

38 A cellular telephone system is a series of transmission facilities or “cell sites,” which

1 use FM radio signals to transmit conversations and data to mobile/portable phone
2 users. Cellular operators are licensed by the Federal Communications Commission
3 (FCC). Cell sites consist of transmitting and receiving equipment and microwave
4 relays, usually mounted on a pole or lattice tower, and ground-mounted switching
5 equipment. In Brier, all of the existing cell sites are co-located on Seattle City Light
6 transmission towers. Cell sites range in size from 1,000 to 2,000 square feet, and
7 are enclosed by chain link fences.

8
9 There currently are four cell sites within the City of Brier. They are located in the
10 following locations: Brier Park operated by T-Mobile; the 23000 block of 32nd
11 Avenue W, operated by Verizon Wireless; and at 236th Street SW and 39th Place W,
12 operated by AT&T and T-Mobile. Various other providers operate sites near the city
13 that provide service within the City of Brier.

14 15 **c. Fiber Optics**

16 As part of the development of a fiber optics “ring” around Puget Sound, one fiber
17 optics system exists in Brier. The fiber optics system is owned by Zayo Group and a
18 portion of it extends from the north city limits, along the west side of Poplar
19 Way/Brier Road, to 236th Street SW. Another portion of its system run’s east- west,
20 along 236th Street SW. Zayo is currently constructing a system that will be located
21 on 32nd Avenue W, extending from 236th Street SW north to 23019 32nd Avenue
22 W.

23 24 **7. Cable Television**

25 Ziplly Communications provides televisions services within the City of Brier to all
26 households who are eligible for the FiOS product, which is an all fiber optic network
27 from the switching stations in Halls Lake and Bothell to the customer’s home. These
28 fiber optic cables are capable of providing telephone, internet, and televisions
29 services, and are placed alongside existing cables on poles, or underground.

30
31 Comcast Cable provides cable television service in the Brier planning area. Brier is
32 served by Comcast from a satellite receiving and processing station located at
33 185th Street SW and 40th Avenue W in Lynnwood. From the receiving station, trunk
34 lines extend through the service area. The trunk lines branch off into distribution
35 cables that carry the signals down residential streets. Cables then extend from the
36 distribution lines to serve individual homes. Cables may be mounted on poles or
37 placed underground. Comcast rents pole space or shares trenches with Snohomish
38 County.

1 Presently, cable service is available to all residences in the City. Comcast Cable
2 officials project no need for additional relay stations or trunk lines to serve the Brier
3 planning area.
4

5 **III. UTILITY ELEMENT GOALS AND POLICIES**

6 GOAL UT 1.0: Ensure that utilities including water supply, sewage disposal,
7 stormwater facilities, electricity, natural gas, and telecommunications
8 are available or can be provided to support current and future
9 development.
10

11 **1. General**

12 UT 1.1: Design and install utilities with sufficient capacity to meet the anticipated
13 land use intensity.
14

15 UT 1.2: Allow new development only when and where such development can be
16 adequately served by essential public utilities without reducing levels of
17 service.
18

19 UT 1.3: Coordinate with utility providers at early stages in planning for needed
20 facilities:

- 21 1) The City shall require that utility providers use the Land Use
22 Element of this Plan in planning future facilities;
- 23 2) The City shall adopt procedures to review and comment on
24 proposed actions and policies of public and private utility
25 providers; and
- 26 3) City coordination may include involvement in consideration of
27 alternatives to new facilities and alternate locations for new
28 facilities.
29

30 UT 1.4: Minimize adverse environmental, aesthetic, and fiscal impacts associated
31 with the siting, development, and operation of utility services and facilities.
32

33 UT 1.5: Require all annexations and new development to connect with City of Brier
34 utilities.
35

36 UT 1.6: Require the location of utility facilities in conduits, shared corridors and
37 trenches to reduce costs, minimize the amount of land allocated for this
38 purpose, and to minimize construction disturbances.

1
2 UT 1.7: Coordinate future utility expansions with the County to ensure consistency
3 with the Countywide Policy Plan.
4

5 **2. Water**

6 UT 2.1: Coordinate with the Alderwood Water District to provide an efficient and
7 adequate water supply to the residents and businesses of the City.
8

9 UT 2.2: Design the size of new water utility systems to the anticipated future
10 requirements of the area's land use.
11

12 UT 2.3: Design new water systems to allow for their extension into potential future
13 service areas.
14

15 **3. Sewer**

16 UT 3.1: Provide an efficient and adequate sanitary sewerage service to the
17 residents and businesses of the City in order to maintain adequate water
18 quality.
19

20 UT 3.2: Encourage the extension of sewers to serve current development where
21 there are limitations to on-site treatment due to soils, topography, or water
22 resources.
23

24 UT 3.3: Require all new development to have sanitary sewer service.
25

26 UT 3.4: Design the size of new sanitary sewerage systems to the anticipated future
27 requirements of the area's planned land use.
28

29 UT 3.5: Design new sanitary sewerage systems to allow for their extension into
30 potential future service areas.
31

32 UT 3.6: Inspect on site wastewater treatment systems frequently, and establish
33 proof of pump out systems in areas with a high risk of system failure.
34

35 UT 3.7: Preserve and enhance water quality by providing adequate sewerage
36 systems adjacent to waterways.
37

38 UT 3.8: Prohibit the development of new pump stations.
39

1 UT 3.9: The latest version of the Brier Comprehensive Sewer Plan is the instrument
2 that should be followed.

3

4 **4. Storm Drainage**

5 UT 4.1: Adopt the most current Washington DOE standards for stormwater runoff.

6

7 UT 4.2: Provide an adequate and cost effective method of preventing property
8 damage from local storm water.

9

10 UT 4.3: Encourage non-structural as well as structural solutions to storm water
11 control.

12

13 UT 4.4: New construction should be designed so that peak storm water discharge
14 is no greater than the discharge was prior to any previous or supposed
15 development.

16

17 UT 4.5: Design street systems to provide that storm water within the right-of way
18 will be maintained within the street area.

19

20 **5. Electrical and Telephone**

21 UT 5.1: Require the undergrounding of all existing distribution points, service
22 drops, and new electrical and communication systems.

23

24 UT 5.2: Require undergrounding to occur in existing easements or right-of-way,
25 whenever feasible.

26

27 UT 5.3: Require the use of one trench in a corridor to accommodate all electrical
28 and communication utilities.

29

30 UT 5.4: Encourage a minimum of disruption to areas affected by the installation of
31 underground utilities.
